

Visualizing Housing Market Trends: An Analysis of Sale Prices and Features using Tableau

Project Development Phase

Project Development

Project Name	Visualizing Housing Market Trends
Team ID	
Date	14 July 2026

Project Overview

The real estate sector generates vast volumes of transactional data covering sale prices, property age, renovation history, and structural features such as bedrooms, bathrooms, and floors. Much of this information remains locked inside spreadsheets that are difficult to interpret at a glance. This project focuses on the design and development of an interactive Tableau-based visualization dashboard that enables users such as real estate analysts, marketing professionals, and property decision-makers to explore housing sale trends and understand how structural and renovation-related features influence overall property value.

Purpose

- Visualize key housing metrics such as sale price, house age, renovation status, and structural features (bedrooms, bathrooms, floors).
- Analyze how years since renovation and house age relate to overall market behaviour and sale price.
- Assess the impact of renovations on property value to support smarter pricing decisions.
- Deliver actionable insights through interactive dashboards and storyboards that support strategic decision-making, optimize pricing models, and enhance market competitiveness.
- Serve a broad range of stakeholders, including real estate analysts, marketing professionals, and decision-makers seeking a clearer understanding of housing market dynamics.

Development Summary

Development followed the technology stack defined during the Design Phase: the dataset was sourced from Google Drive, cleaned and pre-processed in Microsoft Excel (removing duplicates and nulls, standardizing renovation and structural fields, and building calculation fields and pivot tables), then connected to Tableau to build the dashboards, filters, and story points described in the Performance Testing Phase document.
